Each report spans three pages: the question & model answer, a language lab (collocations + sentence frames), and a squared page for your own rewrite.

START HERE

How to use this book

This is a workbook, not a textbook — you learn by doing, not just by reading. It collects twenty-eight of my own Task 1 reports and turns each one into a short, repeatable study cycle. Work through them in order, or jump straight to the chart type you find hardest.

Every report has the same three pages.

Page 1 — Question & model answer. At the top is the exam question exactly as it appears in a real test, followed by the chart or diagram and the full model report. Read the question first and give yourself two minutes to notice the main features before you read my answer. Then read the model and ask: what did I plan to say that the model also says, and what did it do better?

Page 2 — Language lab. This is the heart of the book. It lists ten collocations (natural word partnerships such as a general upward trend) and ten chunks & structures (ready-made sentence frames such as It was X that...), each with a short meaning. Don't try to memorise all twenty. Highlight the four or five that feel most useful and that you don't already use, and copy them into a personal list.

Page 3 — Your turn. Cover the model and rewrite the report from scratch on the squared page, deliberately using a few items from the language lab. The squares keep your handwriting tidy and give a rough sense of length — don't write one letter per box; just fill the space naturally and aim for 150+ words.

A simple weekly routine. Study two or three reports at a sitting. The next day, look only at the questions and try to recall the overview sentence and three collocations from memory. Once a week, redo one squared page without looking at anything — that recall practice is what moves the language into your writing.

At the back of the book you'll find a one-page summary of what a strong Task 1 answer needs, plus a set of review questions and an answer key so you can test yourself.

REPORT 01

Luxury Homes Sold in Eight Cities

BAR CHART

TASK 1 — QUESTION

The bar chart below shows the number of homes, each worth 5 million US dollars or more, sold in eight cities in 2009 and 2014.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

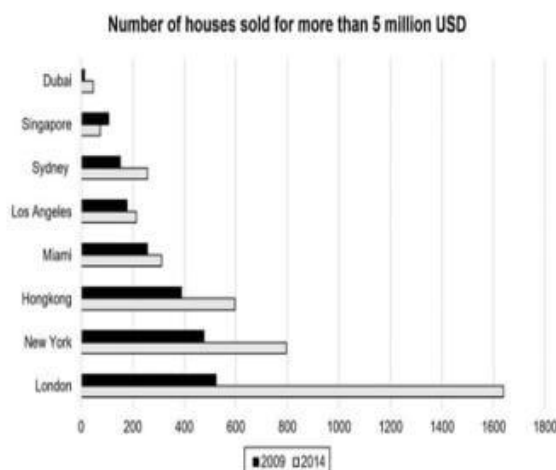

Figure — Bar chart

MODEL ANSWER · 254 WORDS

The bar chart compares the volume of 5-million-worth accommodation in eight cities - Dubai, Singapore, Sydney, Los Angeles, Miami, Hong Kong, New York, and lastly London in the years 2009 and 2014.

As can be seen, London was home to the most marked number of luxury properties consistently, while registering the highest increase, whereas the smallest number of such houses were in Dubai out of mentioned cities. Strikingly, there was a general upward trend in the amount of multi-million dollar houses across all cities, with the sole exception of Singapore.

The gains were not equal between categories. London topped the ranking of the cities with the largest number of expensive houses, accounting for 600 in 2009 and a hefty 1600 in 2014. Followed by was New York, as it housed around 500 houses in 2009, which saw an increase of 150 in 2014; meantime, The result of Hong Kong came in third - nearly 400 and 600 properties between 2009 and 2014 respectively. Miami exhibited relatively negligible surge in the number of luxury houses, increasing from around 250 to 300 during the period.

The remaining countries were responsible for under or around 200 houses worth 5 million US dollars. The figure for LA, while starting at around 190 in 2009, rose to just over 200 until 2014. Sydney accommodated 180 5-million-worth houses in 2009, the result of which reached approximately 230 in 2014, ahead of LA. A stark different trajectory appeared in the index of Singapore, the number of expensive houses in this country went down from 100 to around 80 from 2009 and 2014. Dubai not only registered the smallest change, which was from around 10 to 40, but also the least number of such houses.

LANGUAGE LAB

Language from Report 01

Luxury Homes Sold in Eight Cities

1 · Collocations — word partnerships to reuse

Collocation	What it means
luxury properties	very expensive, high-quality homes.
a general upward trend	an overall pattern of increase over time.
a hefty 1600	an emphatically large number (informal 'hefty' = large).
the sole exception	the only case that does not follow the pattern.
register the highest increase	record / show the biggest rise.
multi-million dollar houses	homes costing several million dollars.
a stark difference	a very clear, sharp difference.
a negligible surge	an increase so small it hardly matters.
the smallest change	the least amount of movement up or down.
top the ranking	be in first place on a list.

2 · Chunks & structures — sentence frames to adapt

Chunk / structure	What it does / means
The bar chart compares the volume of...	opening frame: 'the chart compares the amount of X'.
As can be seen, ...	signposts an obvious feature of the data.
was home to the most marked number of...	'had the largest number of' (marked = noticeable).
with the sole exception of...	'except only for...' — flags the one outlier.
accounting for 600 in 2009	gives an exact figure ('accounting for' + number).
Followed by was...	introduces the next item in a ranking.
came in third	'was ranked third' in an order.
The remaining countries were responsible for...	sums up the lower group with a figure.
rose to just over 200	'increased to slightly more than 200'.
A stark different trajectory appeared in...	'a very different path appeared for...'.

REPORT 02

Tea and Coffee Imported by Four Countries

BAR CHART

TASK 1 — QUESTION

The bar chart below shows the amount of tea and coffee imported by four different countries.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

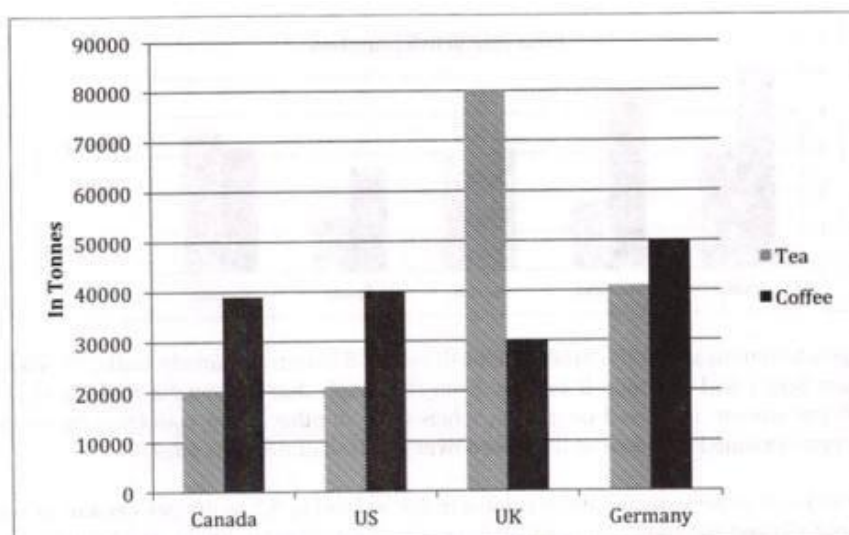

Figure — Bar chart

MODEL ANSWER · 206 WORDS

The report examines differences in the import of tea and coffee, in tonnes, in Canada, The USA, The UK, and lastly Germany.

Focusing on the import levels of tea, The UK is reported to be the leading importer of this drink, importing as much as 80 000 tonnes. Germany imports two times less than this figure, albeit following in second. The import volume of the product is on par in Canada and The US, accounting for 20 000 tonnes.

However, a completely different scenario emerges in terms of coffee import rates. Germany takes the lead in this regard, reporting 50 000 tonnes of the coffee import, while The US also exhibits a noticeable increase to 40 000 tonnes, ranking second. Meantime, Canada comes in fourth, with a margin of 1 000 tonnes compared to the former country. At the end of the scale is The figure for The UK, the import rate of which was responsible for 30 000 tonnes.

In summary, it is evident that The UK heavily focuses on tea imports as opposed to the other three, for which coffee is the main import item than tea. Germany demonstrates relatively greater amounts of coffee import in comparison, whereas there is a correlation regarding import levels of both tea and coffee between Canada and The USA.

LANGUAGE LAB

Language from Report 02

Tea and Coffee Imported by Four Countries

1 · Collocations — word partnerships to reuse

Collocation	What it means
import levels	the amounts that are imported.
the leading importer	the country that imports the most.
import volume	the quantity imported.
on par	at the same level; equal.
take the lead	move into first position.
a completely different scenario	an entirely different situation.
a noticeable increase	a rise that is easy to see.
the main import item	the product imported most.
a margin of 1,000 tonnes	a difference of 1,000 tonnes between two figures.
at the end of the scale	at the lowest point of the range.

2 · Chunks & structures — sentence frames to adapt

Chunk / structure	What it does / means
The report examines differences in...	opening frame for comparing two things.
Focusing on the import levels of tea, ...	narrows attention to one part of the data.
is reported to be the leading...	hedged claim: 'is said to be the top...'
two times less than this figure	'half of this figure' (learner phrasing for a ratio).
albeit following in second	'although it comes second' (albeit = although).
a completely different scenario emerges	signals a contrast with what came before.
in this regard	'concerning this point' — links back to a topic.
ranking second	'in second place' (participle after a figure).
comes in fourth	'is placed fourth'.
In summary, it is evident that...	closing frame that states the clear overall point.

REPORT 03

Water Consumption and Use in Australia (2004)

PIE & BAR CHART

TASK 1 — QUESTION

The pie and bar charts below show the percentage of water consumption and use in Australia in 2004.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

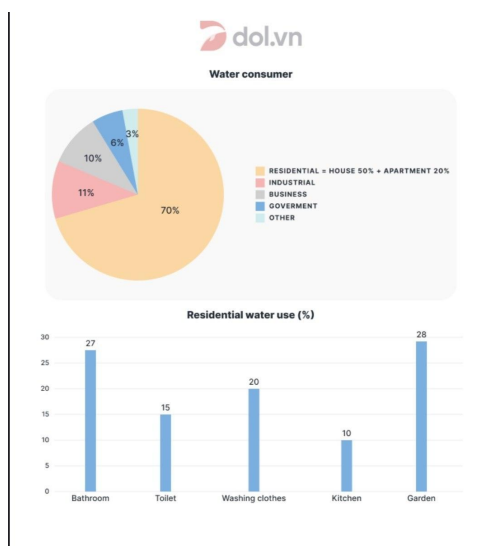

Figure — Pie & bar chart

MODEL ANSWER · 197 WORDS

The report compares the percentage terms of main water consumers in Australia in the pie chart and areas of residential water use in 2004 in the bar chart.

As can be seen, residents consumed the most significant part of the total water consumption, followed by industries, businesses, the government and other undefined sectors. The garden tops the ranking of the residential water usage, whereas kitchen makes up the smallest percentage of consumption.

Residents were the leading utilizers of water in the country, making up a hefty 70%. Of these, 50% accounted for the share of houses, while apartments were responsible for 20%. The share of industrial and business water usage were somewhat similar (11% vs 10%). 6 percentage points less was the share of the government, whilst at the bottom of the list stood the share of other unspecified consumers, constituting 3%.

Moving on, water consumption in residential areas were directed to five areas, with which category making up the highest percentage being gardens at 28% in this regard. The percentage of bathrooms followed in a close second, at 27%. Residents used 20% of the total water for the laundry, while 15% was used in the toilet. The least percentage of water was utilized in the kitchen, accounting for 10%.

LANGUAGE LAB

Water Consumption and Use in Australia (2004)

1 · Collocations — word partnerships to reuse

Collocation	What it means
water consumption	the amount of water used.
main water consumers	the sectors that use the most water.
residential water use	water used in homes.
the leading utilizer	the biggest user.
make up 70%	form / account for 70% of the total.
a hefty 70%	a large share of 70% (informal emphasis).
unspecified sectors	categories not named individually ('other').
percentage points	the unit for the gap between two percentages.
at the bottom of the list	in last place.
the highest percentage	the largest share.

2 · Chunks & structures — sentence frames to adapt

Chunk / structure	What it does / means
The report compares the percentage terms of...	opening frame focused on shares/percentages.
As can be seen, residents consumed the most...	signposts the main feature of a pie chart.
followed by industries, businesses...	lists items in descending order.
Of these, 50% accounted for...	breaks a group down into sub-parts.
were somewhat similar (11% vs 10%)	notes two close figures with a comparison.
6 percentage points less was the share of...	front-loads the gap for emphasis.
whilst at the bottom of the list stood...	'while in last place was...' (whilst = while).
Moving on, ...	transition to the next part of the answer.
with ... making up the highest percentage	attaches the top share to a category.
The least percentage of water was utilized in...	'the smallest share was used in...'

REPORT 04

Time Taken to Produce a Vehicle

LINE GRAPH

TASK 1 — QUESTION

The graph below shows the amount of time taken to produce a vehicle by four US-based car manufacturers in the years 1998 to 2002.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

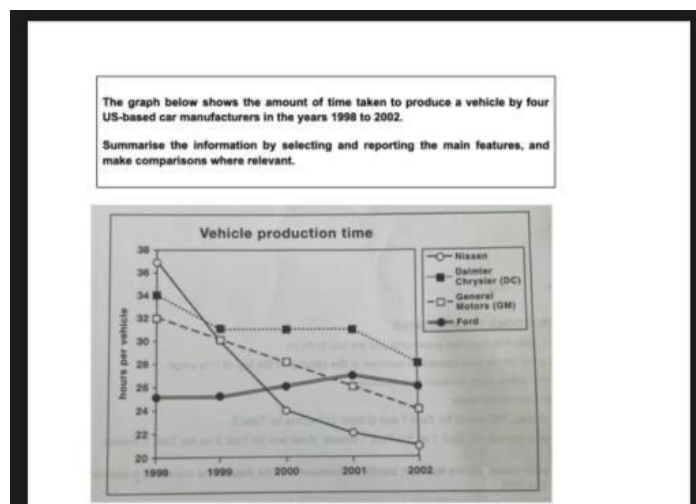

Figure — Line graph

MODEL ANSWER · 292 WORDS

The report outlines changes in the number of hours required to manufacture a vehicle across four car producing companies in the USA - Nissan, General Motors, Ford, and lastly DC from 1998 to 2002.

Overall, the car manufacturing saw a great deal of efficiency in terms of the hours needed to produce amongst all car manufacturers, except for DC, albeit at varying degrees over the years. Notably, it was Nissan that represented the most marked decline, whereas relatively moderate changes were shown by Ford and General Motors. By the end of the period, Ford stood out as the manufacturer with the most long hours of production.

The most significant downward trend was shown by General Motors during the period, which started at the top spot in 1986, requiring as much as nearly 37 hours. However, this figure had plummeted drastically by 2009, reaching 24 hours, which followed by a further decrease to 22 hours. In 2002, General Motors produced a vehicle less than 20 hours.

Meantime, The figure for DC and General Motors, starting in second and third respectively, saw a reduction as not noticeable as the previous company. The former took 34 hours to manufacture a car in 1986, which then showed a decrease of 2 hours in 1996 before remaining stable at this point until 2001. There was again a drop in the amount of hours in 2002 to 30 hours by DC. In contrast, The trend for General Motors followed a rather straight trajectory, showing an interval-on-interval decline of 2 hours from 1986 to 2002, going down from 32 hours to 24 hours.

Surprisingly, the production of Ford vehicles rose at a gradual degree. It took off at about 23 hours in 1986, and then increased negligibly to 25 hours until 2000. The manufacturer of vehicles then went up to 26 hours in 2001, after which the amount of hours revised downwards to 24 hours in the end.

LANGUAGE LAB

Language from Report 04

Time Taken to Produce a Vehicle

1 · Collocations — word partnerships to reuse

Collocation	What it means
car manufacturers	companies that make cars.
a great deal of efficiency	a large improvement in how well time is used.
the number of hours required	how many hours are needed.
the most marked decline	the clearest, biggest fall.
moderate changes	medium-sized changes, neither large nor small.
production time	the time needed to make something.
stand out as...	be clearly noticeable / different.
at varying degrees	by different amounts.
car-producing companies	firms that manufacture cars.
by the end of the period	at the final point in the time range.

2 · Chunks & structures — sentence frames to adapt

Chunk / structure	What it does / means
The report outlines changes in...	opening frame for a change-over-time task.
the number of hours required to manufacture...	a precise topic phrase ('hours required to' + verb).
across four car-producing companies	'over / among four companies' (across = among).
saw a great deal of efficiency	'became much more efficient' ('saw' + noun).
except for DC	excludes one item from a general statement.
albeit at varying degrees	'though by different amounts' (concessive).
it was Nissan that represented...	cleft sentence for emphasis on the subject.
relatively moderate changes were shown by...	passive frame to foreground the change.
By the end of the period, ... stood out as...	time-marker + emphasis on a final feature.
the manufacturer with the most...	superlative frame identifying the top case.

REPORT 05

Computer Ownership in the US (1997–2012)

LINE GRAPH

TASK 1 — QUESTION

The graph below shows the percentage of households in the US owning no computer, one, two, and three or more computers between 1997 and 2012.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

The chart below gives information about computer ownership in the US from 1997 to 2012.

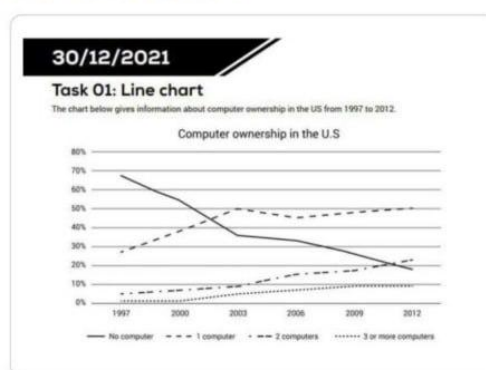

Figure — Line graph

MODEL ANSWER · 240 WORDS

The report provides an insight into changes in the percentage of computer ownership in the U.S between 1997 and 2012, comparing percentages of those who owned no computer, 1, 2 and 3 or more computers.

As can be seen, the country enjoyed a general upward trend in the percentage of those possessing the device during the period. The most notable increase was observed in the figure for those owning a single device, topping the list as well, whereas the percentage of individuals with 3 or more computers remained at the bottom of the list with the least marked increase over the years.

The computer ownership became more prevalent in the country from 1997 to 2012. Having started at nearly 30% in 1997, the figure for people with a single device rose by 20 percentage points in 2003. However, this figure was down 5 percentage points in 2006 before recovering to 50% in 2012, eventually finishing the period at the top. Despite a relatively moderate growth, owning two computers appeared as the second most popular type of ownership by 2012 at just above 20% - this was up nearly 12 percentage points from 1987. Likewise, the figure for owning 3 computers and more than this registered an increase to 10 % until 2012, which started at a trough of 1% in 1987.

Due to the general surge in the index of ownership, there was a drastic decline in the proportion of 'no computer' category. After starting at 70% in 1987, the figure dropped gradually to around 35% until 2003. From then on, it recorded a slow reduction of 15 percentage points until 2012.

LANGUAGE LAB

Top-200 Universities by Subject (2011)

TABLE

TASK 1 — QUESTION

The table below shows the number of universities from five countries appearing in the world's top 200 in three subjects — Biology, Medicine and Psychology — in 2011.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

WRITING TASK 1

You should spend about 20 minutes on this task.

The table shows the number of universities ranked top 200 in the world (2011) in three subjects in five countries.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

Number of universities ranked top 200 in the world (2011)

Country	Subjects		
	Biology	Medicine	Psychology
The USA	69	54	58
The United Kingdom	30	24	29
Australia	9	13	17
New Zealand	6	2	4
Canada	9	12	14

Figure — Table

MODEL ANSWER · 209 WORDS

The table illustrates how many universities from five countries featured in the global top 200 rankings across three academic disciplines — Biology, Medicine, and Psychology — in 2011. Overall, the USA dominated all three subject areas by a considerable margin, followed distantly by the UK. The remaining three countries — Australia, Canada, and New Zealand — recorded substantially lower figures across the board, with New Zealand consistently placing last.

The USA and The UK exhibited the greatest number of top-ranking universities. Biology was the most renowned area in these countries, with the former accounting for 69 institutions - almost twice as many as the result of the latter. Psychology was another popular field in these countries, with The USA accounting for 58 world-leading institutions and The UK for 29, while Medicine figures ranked third, where the result of USA was responsible for 54 - 30 more universities than in The UK.

Remaining countries showed notably fewer numbers. Australia came in third place in the ranking of the amount of top-ranking universities, with 9 in Biology, 13 in Medicine, and 17 in Psychology. In the fourth place was Canada, with the identical number of world-class institutions in Biology, 12 in Medicine, and 14 in Psychology. At the lower end of the spectrum was New Zealand, which numbered a mere 2 universities in Medicine, 4 in Psychology, and 6 in Biology.

REPORT 07

Tourists' Transport Modes from Five Countries

BAR CHART

TASK 1 — QUESTION

The bar chart below shows the percentage of tourists from five different countries using four types of transport: cars, air, coach and ferry.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

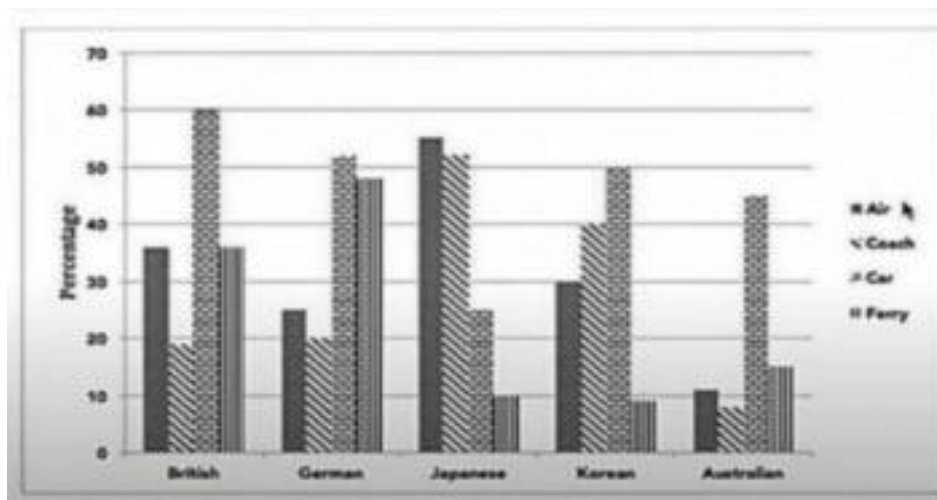

Figure — Bar chart

MODEL ANSWER · 296 WORDS

The bar chart compares the percentage terms of travelers from Britain, Germany, Japan, Korea, and Australia utilizing modes of transport - planes, coaches, cars, and ferries. In general, preferences among nations are quite varying, although there seems to be notable preference toward cars among all nations, but Japan whose residents primarily rely on planes for their travels. For Japanese, Korean, and Australian tourists, the least opted means of transport is a ferry, whereas it is a coach that proves to be of lesser popularity among British and German travelers.

Focusing on countries as in the order of the chart, 60% of tourists from Britain cites cars as their top option, followed by an identical share of those who prefer planes and cars (35%). Those who choose ferries as their means of transport make up 20%. Among German travelers, cars bear more popularity, accounting for just above 50% - around 5 more percentage points than those who use ferries. The percentage of planes follows with a considerable margin at 25%, while the result of coaches constitute 20%.

Japanese tourists appear to enjoy air travels, as nearly 55% of them prefer planes. This is up 5 percentage points than the proportion of coach users, whilst cars are opted by about 25% of total tourists. At the end of the scale is the result of ferries, accounting for a meager 10%. In contrast, the majority of travelers from Korea favor using cars, with 50%. Coaches place second in terms of popularity, and cars follow in third (40% vs 35% respectively). Ferries, like the former country, are the least popular means of travel among Koreans, recording around 9%.

In comparison, Cars are near dominant means of transport among Australians at 45%, with a significant margin compared to other modes of travel. The percentage of those using ferries make up 25%, while that of planes and coaches average around 10%.

REPORT 08

Airline Ticket Prices: Sydney–Melbourne

TABLE

TASK 1 — QUESTION

The charts below give information about the price of tickets on one airline between Sydney and Melbourne, Australia, over a two-week period in 2013.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

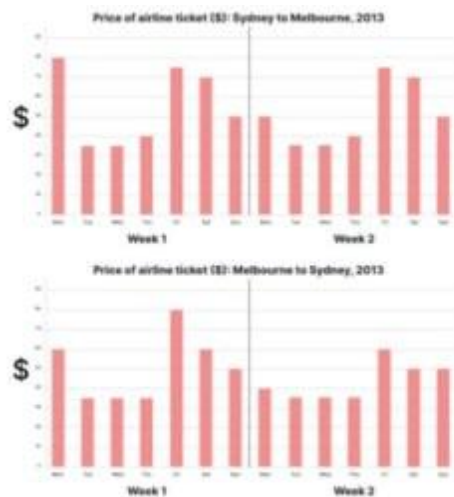

Figure — Table

MODEL ANSWER · 248 WORDS

The report provides data regarding ticket price changes, in US dollars, between Sydney and Melbourne, Australia, over a period of two weeks in the year 2013. In general, the disparity of airfares in both routes was nowhere dramatic. On week days, particularly on Tuesday, Wednesday, and Thursday, booking price was relatively cheaper as opposed to Friday, when the price, regardless of the period and the route, was significantly expensive.

Focusing on the flight fee from Sydney to Melbourne, the price stood at 80 dollars in the first week, this was up 40 dollars than the second week. Between Tuesday and Thursday, the flight cost remained unchanged over two weeks, hovering around 30 dollars, while the first-week price started to shoot up to around 75 dollars, and then dipped slightly by 5 dollars on Saturday before further declining to 50 dollars, the price that did not show any changes in the second week.

There was a similar trend in the return fare (from Melbourne to Sydney). Monday flight fare was moderately cheaper in this route, at 60 dollars in the first week. This price was down 20 dollars the next week. The price was stable at about 35 dollars in both weeks, from Tuesday to Thursday, the result of which only peaked at 80 dollars in the week 1. However, this showed a decline of nearly 20 dollars in the week 2, whereas the flight fare was comparatively higher in the first week on Saturday than in the following week (60 vs 50 dollars). Notably, the Sunday price was identical in both weeks, at 50 dollars.

REPORT 09

Redevelopment of Walton Museum

MAPS / PLANS

TASK 1 — QUESTION

The plans below show the South Wing of Walton Museum in 2008 and after its redevelopment in 2012.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

The plans below show the South Wing of Walton Museum in 2008 and in 2012 after it was redeveloped. Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

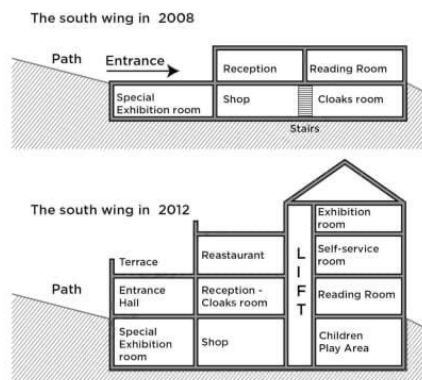

Figure — Maps / plans

MODEL ANSWER · 237 WORDS

The pictures illustrate the redevelopment of the South Wing of Walton Museum from 2008 to 2012. As can be seen, the traditional layout of the museum transformed profoundly, experiencing a number of significant alterations - an addition of restaurant, a children's playground, a self-service room, and a brand-new exhibition room. These changes resulted in the museum appearing with more floors, while a lift made it more visitor-friendly.

Prior to the transformation of the museum, the access was through a path directly leading a reception, after which was a reading room on the first floor. In the ground floor, there was a special exhibition room - under the entrance - which was accessible through a shop, while in the bottom-left hand corner lied a cloak room. Further, stairs joined both floors.

After the redevelopment in 2012, visitors could access the museum through an entrance hall, which was located in the former entrance road, above which was a newly-built open terrace. The reception also accommodated a cloak room within itself, again there constructed a restaurant on top of which. The other two facilities in the ground floor had remained intact, although stairs were removed to make way for a newly installed lift. A construction of a playground for children resulted in the relocation of a cloak room on the left at the bottom, whereas a self-service room and an additional exhibition room emerged on the third and fourth floors of a reading room respectively.

REPORT 10

Sydney Train Passengers & Punctuality

LINE GRAPH

TASK 1 — QUESTION

The graphs below show the number of passengers (in millions) using trains in Sydney and the percentage of trains running on time between 1995 and 2004.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

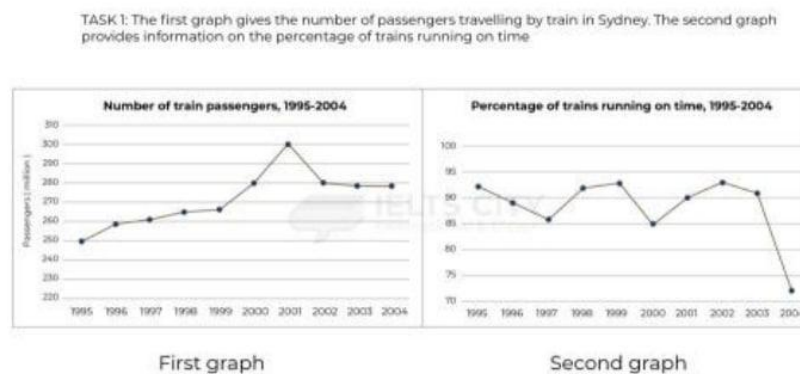

Figure — Line graph

MODEL ANSWER · 196 WORDS

The line graphs illustrate data regarding how many passengers, in millions, used trains in Sydney, along with the percentage of trains running on time from 1995 to 2004. Overall, there was a considerable increase in the number of rail commuters during the period, with the all-time figure observed in 2001. Meantime, punctual train services were rather erratic for most of the years, eventually plummeting by the end of the period.

More travellers used trains in the city in 2004 than in 1995, when 250 million commuters were registered. This figure slowly climbed to nearly 270 million in 1999, followed by a marked growth of 50 million commuters in 2001 - the all-time-high result in the graph. From then on, the figure for rail commuters dropped to 280 million, and it then remained stable until 2004.

In comparison, the percentage of trains operating on schedule exhibited notable changes. In 1995, the proportion of punctual trains accounted for around 93%, but this was followed by a drastic decline of 13 percentage points in 1997. However, the figure then recovered to its initial point by 1999, whereas a further decrease was recorded in 2000, down to 85 %. There was again a surge in the percentage of trains operating on time to nearly 95% until 2002 before dipping markedly to almost 70% in 2004.

REPORT 11

Cost of Clothing Exports to the EU

BAR CHART

TASK 1 — QUESTION

The bar chart below shows the average cost, in pounds per kilometre, of clothing exported to the European Union from six countries in 1997 and 2003.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

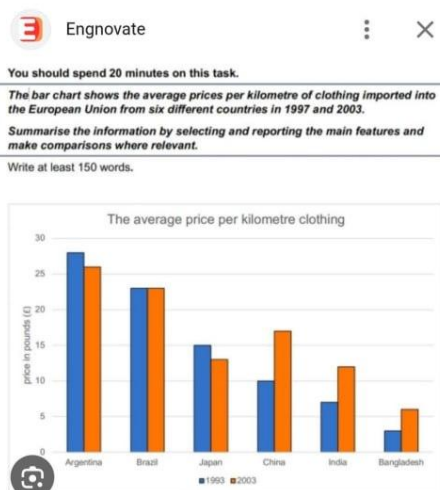

Figure — Bar chart

MODEL ANSWER · 226 WORDS

The bar chart compares the average cost, in pounds per kilometre, of clothing exported from 6 countries - Argentina, Brazil, Japan, China, India, and Bangladesh - to the European Union in the years 1997 and 2003. Overall, Argentina recorded the highest clothing export prices throughout the period, whereas Bangladesh's clothing was the most affordable. Strikingly, there was a downward trend in the price of clothing in Argentina and Japan over the years, whilst China, India, and Bangladesh registered the reverse trend. In contrast, the figure for Brazil remained stable over the period.

Focusing on countries with the greatest export prices, Argentina topped the list as in 1997 the price of one kilometre clothing averaged at around 28 pounds, but this was down 3 pounds in 2003. Brazil followed in a close second, with its price staying unchanged at about 23 pounds from 1997 to 2003. The cost of the clothing in Japan was the third highest at 15 pounds in 1997, the result of which showed a reduction of 2 pounds in 2003.

With regard to the lower-priced exporters, the price in China, which stood at 10 pounds in the fourth place in 1997 climbed to 17 pounds by 2003, leapfrogging Japan to take third place overall. Meanwhile, the figure for India ranked fifth, which surged from approximately 7 pounds to 12 pounds during the period. Bangladesh, though still the most affordable exporter, saw its price more than double - rising from around 3 pounds in 1997 to 7 pounds in 2003.

REPORT 12

Growth of the City of Alexandria

MAP & GRAPH

TASK 1 — QUESTION

The map and graph below show the growth in the physical size and population of the Egyptian city of Alexandria between 1840 and 1980.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

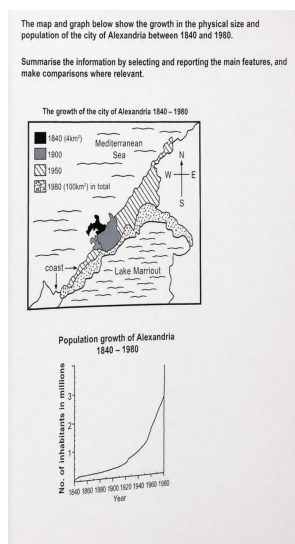

Figure — Map & graph

MODEL ANSWER · 200 WORDS

The report examines information about the spatial expansion and the population growth of the city of Alexandria from 1840 to 1980. Overall, Alexandria underwent significant spatial expansion throughout the period, ultimately extending across all coastal areas from the Mediterranean Sea to Lake Mariout. The population demonstrated steady growth across most of the period, though the growth trajectory accelerated notably towards the end of the timeframe, with the most dramatic expansion occurring in the final decades.

With regard to the extension of the city, Alexandria occupied a small cape in the west of the mainland in 1840, covering around 4 km². By 1900, the city had stretched southeastward toward Lake Mariout, which showed additional expansion along the southern coastline and also further to the north, yet at a drastic volume, in 1950. After 30 years, the city, covering 100 km² in total, extended along the banks of Lake Mariout ranging from south-west to south-east.

The city witnessed a marked overall growth of the population over the years, commencing at just 100 000 in 1840. This figure exhibited a negligible increase of 400 000 dwellers until 1920 at which point the population ratio moderately surged to 1 million in 1940. From then on, the figure registered a drastic growth to 3 million in 1980 - the all-time-high result in the chart.

REPORT 13

The UK Steel Industry (1970–2000)

LINE GRAPH

TASK 1 — QUESTION

The graphs below show the total demand for steel, along with production and import levels, and the number of workers employed in the UK steel industry between 1970 and 2000.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

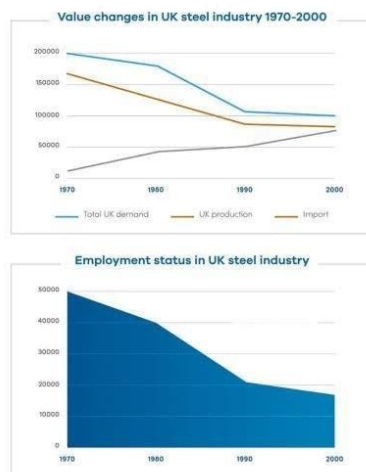

Figure — Line graph

MODEL ANSWER · 216 WORDS

The line graphs illustrate the alterations in the total demand, the production and import rates for the UK steel industry from 1970 to 2000, along with changes in employment levels. In general, domestic demand for steel declined substantially throughout the period, albeit consistently exceeding both production and import volumes. The figure for import underwent a similar trajectory, whereas there was a downward trend in the steel manufacturing. Employment in the sector experienced steady contraction over the years.

Examining demand patterns, the UK consumed approximately 200 000 tonnes in 1970, representing the highest consumption level. This was down around 20 000 until 1980, then dropping more steeply to just above 100 000 in 1990. From this point on, it mainly hovered around this figure until 2000.

As for the import rate, around 160 000 tonnes of steel was imported in 1970, which exhibited a drastic decline of 70 000 tonnes by 1990, at which point the figure for import rate followed a similar trajectory as the former. This contrasts sharply with production levels, which surged noticeably from approximately 10 000 in 1970 to nearly 50 000 in 1980, a result that would remain primarily unchanged until 1990. By 2000, the industry produced more steel than the previous decade, accounting for 80 000 tonnes.

With regard to employment, 50 000 workers were employed in the steel industry in 1970, which dropped by 10 000 workers in 1980. By 1990, the downward trend accelerated and hit 20 000 employees before further going down to about 18 000 in 2000.

The graph below shows the percentage of female members of parliament in five European countries, from 2000 to 2012.

Summarise the information by selecting and reporting the main features, and make comparison where relevant.

Write at least 150 words.

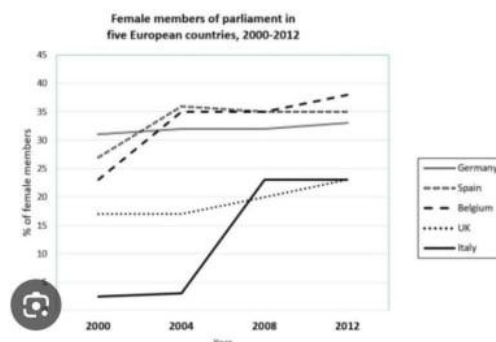

Figure — Line graph

MODEL ANSWER · 238 WORDS

The line graph illustrates changes in the percentage terms of women in the parliament in Germany, Spain, Belgium, The UK, and lastly Italy between 2000 and 2012. Overall, all countries witnessed an upward trend in the proportion of female parliament members during the period, albeit at varying degrees. The country with the most marked amount was Spain, whereas The figure for The UK and Italy trailed behind at a similar percentage, with the latter exhibiting the most notable change over the years.

Germany, Spain, and Belgium had by far the largest proportion of female parliamentarians throughout. In 2000, just above 30% of the parliament was accountable for females in Germany, the result of which then hovered until 2008 before edging up by two percentage points in 2012 (33%). As for the figure for Spain, it started the period at around 26% and surged to about 37% in 2004, a figure which would then negligibly decline to 35% by 2012. Likewise, The amount of female parliament members increased notably to 35% in 2004 - up from approximately 23% in 2000. The figure was stable until 2008 before an increase of 3 percentage points in 2012, accounting for a chart-peak percentage at 38%.

Belgium and Italy, however, showed smaller percentages of women as parliament members. The former reached approximately 23% in 2012 - up from 17% from 2000 to 2004. The trend was relatively drastic for the latter, which climbed to nearly 25% in 2008 after remaining unchanged at 3% between 2000 and 2004. By 2012, the proportion of women parliamentarians accounted for 23%, eventually ending the period at an identical result as Belgium.

REPORT 15

US Government Spending on Research

LINE GRAPH

TASK 1 — QUESTION

The graph below shows the amount of money (in billions of US dollars) the US government spent on research in five sectors between 1980 and 2008.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

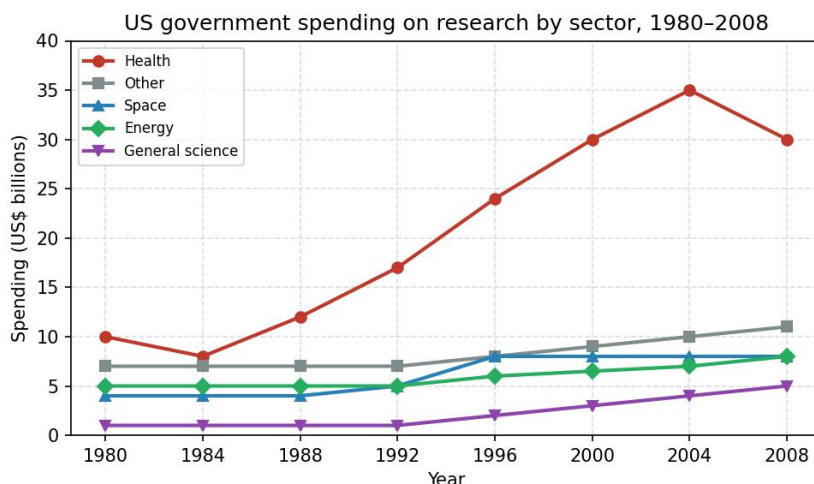

Figure — line graph (redrawn from the model answer's figures for study use)

MODEL ANSWER · 259 WORDS

The line graph illustrates changes in government funding allocated to 5 sectors - Health, Space, Energy, General science, and other undefined sectors - in the USA from 1980 to 2008. Overall, All sectors witnessed increased investment over the years, albeit at varying degrees. The health sector exhibited by far the largest amount of funding and recorded the most pronounced change during the period, whereas general science received the smallest allocation during the period.

It was the health sector that demonstrated notable changes from 1980 to 2008. Starting at nearly 10 billion dollars, the figure for health dipped slightly to 8 billion in 1984, a figure which then skyrocketed to about 35 billion by 2004. However, the US government allocated 5 billion less to health in 2008.

For the remaining categories, figures were mainly stable from 1980 to 1992. The result of other unspecified spending sectors fluctuated at around 7 billion dollars in that time frame, while a similar trajectory was observed in the amount of investment Space and Energy sectors received, with respective figures of approximately 4 and 5 billion. An even smaller amount of money was allocated to General Science, the result of which stood still at a mere 1 billion dollars between 1980 to 1992.

During the further span, these categories registered increases. The government funding for other undefined sectors rose gradually to above 10 billion until 2008, whereas the figure for Space sector, having climbed to about 8 billion in 1996, remained unchanged until 2008. The Energy sector also saw a slow growth of funding by 4 billion, reaching 8 billion dollars in 2008 - a somewhat similar result to the figure for space. Meanwhile, 5 billion dollars were spent on general science toward 2008 - up 4 billion dollars from 1992.

Household Water Use (1988 vs 2008)

PIE CHART

TASK 1 — QUESTION

The pie charts below show the amount of water used in an average household in an Australian city in 1988 and 2008.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

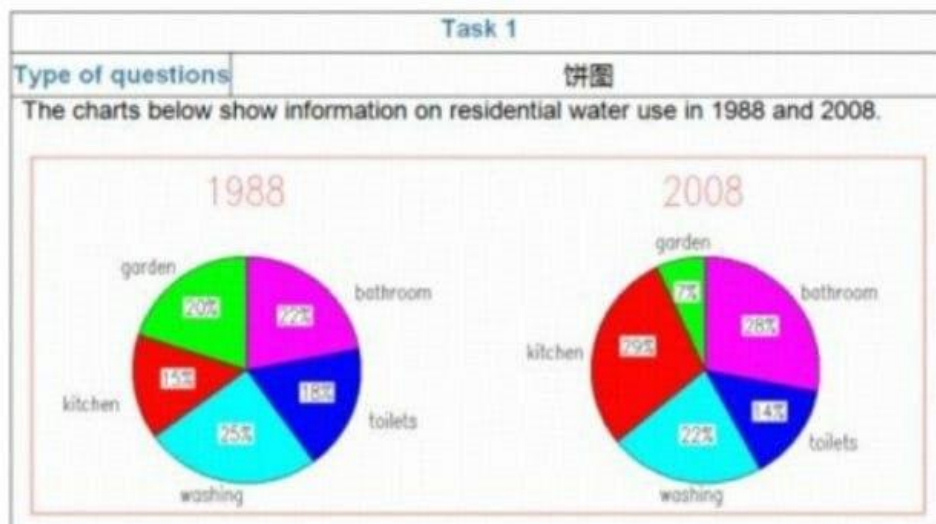

Figure — Pie chart

MODEL ANSWER · 228 WORDS

The pie charts compare the use of water in residential areas across 5 categories - a bathroom, toilets, washing, a kitchen, and a garden - in the years 1988 and 2008. Overall, the most noticeable share of household water consumption was directed towards kitchen, whilst gardening accounted for the smallest share of water usage. Of a particular note, there was an upward trend in the figure for kitchen and bathroom water usage, while other categories experienced the opposite trajectory during the period.

In 1988, households utilized 25% of the total water to do the laundry, making it the category with the highest share - 3 percentage points up from the share of bathrooms, which followed in second. The proportion of gardening ranked third in the ranking of the most water demanding households sectors, accounting for 20%, with the share of toilets in fourth and kitchen in fifth (18% vs 15%).

By 2008, the share of water used in kitchens was able to exceed that of other categories and place in the first spot at 29%, followed by that in bathrooms with a margin of a mere point. The proportion of washing, having fallen two ranks to the third place, made up 22% of the total domestic water demand. Further, households spent 14% of the total water in toilets - coming in fourth - whereas the share of water used in gardens was twice as less as than this, which lied at the bottom of the list.

Unemployment & Emigration in Ireland

LINE GRAPH

TASK 1 — QUESTION

The graph below shows unemployment levels in Ireland and the number of people leaving the country between 1988 and 2008.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

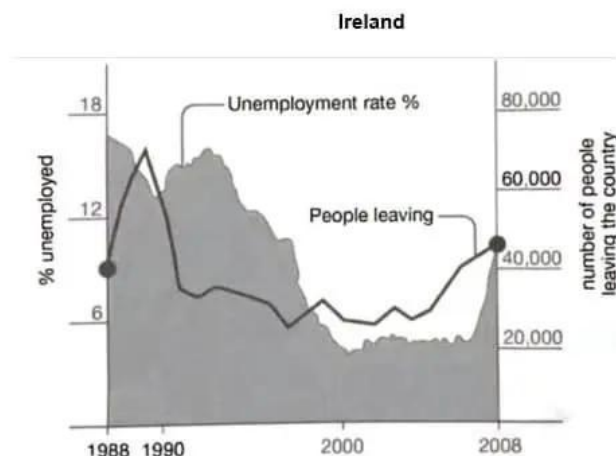

Figure — Line graph

MODEL ANSWER · 167 WORDS

The line graph illustrates changes in Ireland's unemployment rate and emigration figures from 1988 to 2008. Overall, both metrics experienced significant fluctuations throughout the period. The unemployment rate showed dramatic volatility, with the most pronounced decline occurring in the latter half of the period. In contrast, emigration figures remained relatively stable, with the exception of notable peaks in the early years and a sharp increase by 2008. Examining the unemployment rate, 1988 recorded the highest level at approximately 17%. This declined to approximately 13% by 1990, then rose again to nearly 18% in 1991. Subsequently, a consistent downward trend emerged, with unemployment falling steadily to approximately 5% by 2000. The rate remained relatively stable until around 2007, when it surged sharply to reach approximately 12% by 2008. Emigration figures displayed a contrasting pattern. Starting at approximately 40,000 in 1988, emigration rose dramatically to reach approximately 80,000 by 1990—representing the peak during the early years of the period. Subsequently, emigrant numbers declined sharply to approximately 30,000 by 1998, the lowest level recorded. From this point onwards, emigration figures fluctuated around 30,000 to 40,000 until 2008, when they increased to approximately 40,000.

Tourists to Australia (1995 & 2005)

BAR CHART

TASK 1 — QUESTION

The charts below show the number of tourists visiting Australia from three countries in 1995 and 2005, and the types of travel used between 1995 and 2005.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

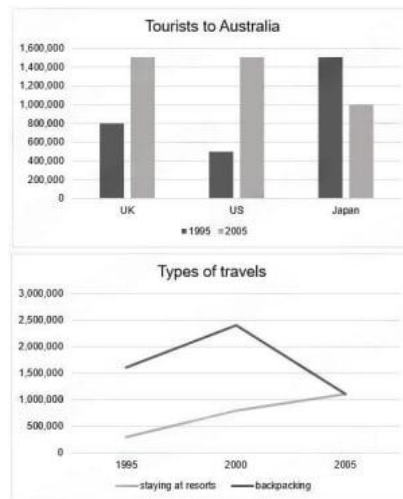

Figure — Bar chart

MODEL ANSWER · 219 WORDS

The charts present visitor numbers to Australia from three countries - The UK, The USA, and Japan - in 1995 and 2005, along with data on travel preferences between these years.

Overall, there was a pronounced growth in visitor numbers from both The UK and The USA over the years, whilst the reverse is true for Japan. Regarding travel types, backpacking numbers - unlike staying at resorts - experienced a downward trend during the period, remaining more popular than staying at resorts though.

With regard to country-specific visitor trends, Japan dominated in 1995 with approximately 1.6 million tourists, substantially exceeding both The UK and The USA. British visitor numbers stood at 0.8 million - 0.35 higher than American visitors at 0.45 million. By 2005, a situation had reversed notably. A similar number of 1.5 million visitors was recorded by both The UK and The USA, experiencing a drastic increase, while the figure for Japan exhibited an opposite of this, declining to 1 million tourists.

Backpacking was the all-time preferred form of travel from 1995 to 2000. Starting at just above 1.5 million, The trend rose by nearly a million in 2000, representing the peak for this travel type. However, this was followed by a noticeable drop to almost 1 million in 2005. Resort stays, by contrast, showed a steady increase throughout the period, rising from 0.5 million in 1995 to 1 million by 2005. At this point, backpacking and resort stay numbers were identical.

Consumption of Five Kinds of Jam

LINE GRAPH

TASK 1 — QUESTION

The graph below shows the consumption of five kinds of jam (in millions of units) between 2009 and 2014.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

The chart shows the sales of five different kinds of jam from 2009 to 2014

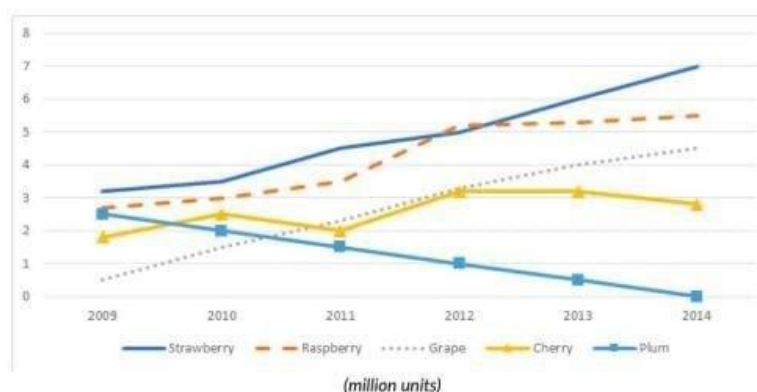

Figure — Line graph

MODEL ANSWER · 251 WORDS

The line graph illustrates the consumption figures, in millions, for 5 varieties of jam - strawberry, raspberry, grape, cherry, and plum - between 2009 and 2014. Overall, all varieties of jam, except for plum, enjoyed a general upward trend throughout the period, albeit at varying degrees. The most notable change was demonstrated by strawberry consumption, whereas cherry product volumes accounted for the smallest one. Examining the market-leading varieties of jam during the period, strawberry dominated the market for most of the period. In 2009, just above 3 million units of strawberry product were purchased, demonstrating a gradual increase until 2014, climbing to a record high of 7 million. Raspberry held second position in the standings of best-selling jam varieties, accounting for around 2.8 million units consumed in 2009 and increasing slowly to 3.5 million in 2011. In 2012, raspberry consumption volumes surpassed that of strawberry and peaked at just above 5 million, from which point on demand stabilized around 5.5 million until 2014. Despite being the weakest-performing category in 2009 at half a million, grape product volumes demonstrated steady expansion until 2014, arriving in third place at about 4.5 million. Moving on, cherry product occupied fourth position in 2009, at below 2 million. These volumes then fluctuated until 2011 before a noticeable increase to 3 million in 2012, after which demand remained stable until 2013. By 2014, there was a slight decline in cherry consumption to around 1.8 million, maintaining fourth place in product standings. Plum consumption levels, by contrast, exhibited a significant decrease. The metric stood at 2.5 million initially, which then revealed a period-by-period decline of half a million until 2014, becoming the marginal variety at nearly zero consumption.

People Exposed to Noise Pollution in Europe

BAR CHART

TASK 1 — QUESTION

The bar charts below show the number of people (in millions) exposed to harmful noise levels from four sources during the day and at night in urban and rural areas of Europe in 2007.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

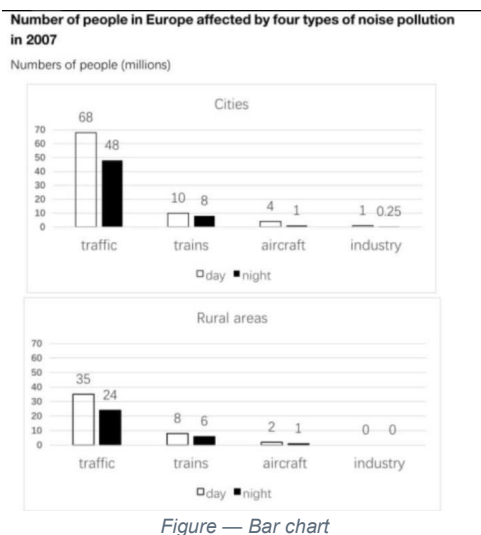

Figure — Bar chart

MODEL ANSWER · 265 WORDS

The bar charts compare the number of individuals exposed to harmful levels of noise in Europe, both during the day and at night, across rural and urban regions in 2007. In general, the effect of noise pollution was significantly greater in cities than in the countryside. Furthermore, the number of people exposed to harmful noise levels — regardless of region — was consistently higher during the daytime than at night. Traffic was the main driver of noise pollution in both urban and rural areas, while industry was the least significant source.

Traffic appeared to be the leading contributor to noise pollution in cities, accounting for 68 million and 48 million affected urban dwellers during the day and night respectively. The figures dropped considerably when the impact of trains was recorded, with trains responsible for 10 million individuals during the day and 8 million at night. The number of those exposed to harmful noise levels due to aircraft fell further, to 4 million during the day and 1 million at night, while industry was the category with the fewest affected city dwellers, at 1 million during the day and a quarter of that figure at night.

In contrast, figures were noticeably lower in rural areas. Traffic remained the primary cause of noise pollution, with 35 million daytime and 24 million night-time affected individuals. These numbers dropped by almost a third when train-related noise was recorded, registering 8 and 6 million people during the day and night respectively. The least impact was seen from aircraft-related noise, with figures of 2 million during the day and 1 million at night, while industry showed no individuals exposed to noise above healthy levels in the countryside.

Renewable Energy in the Total Supply

BAR CHART

TASK 1 — QUESTION

The bar chart below shows the proportion of renewable energy in the total energy supply of four countries between 1997 and 2010.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

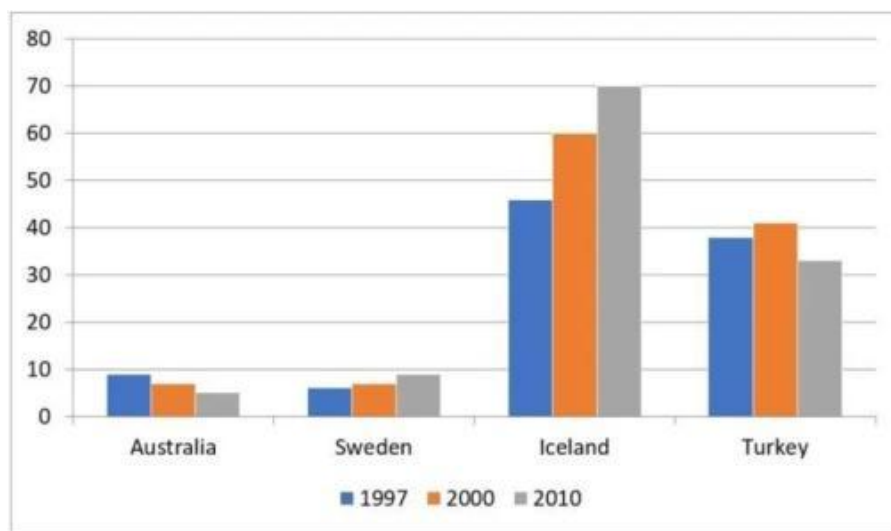

Figure — Bar chart

MODEL ANSWER · 160 WORDS

The bar chart compares the proportion of the total renewable energy supply in Australia, Sweden, Iceland, and Turkey between 1997 and 2010. Overall, the share of renewable energy appeared to rise, albeit at varying degrees, in Sweden and Iceland, whilst Turkey and Australia saw the opposite trend over the period in question. Iceland was consistently the leading country with the highest proportion of renewable energy supply.

With regard to the countries with the largest share of renewable energy, Iceland topped the list with a starting point of around 45%, which increased by approximately 15 percentage points in 2000 and a further 10 points by 2010. Turkey followed in second place, with figures showing negligible growth from approximately 48% to 50% between 1997 and 2000. However, by 2010, Turkey's supply had dropped by around 10%.

At the bottom of the list were Australia and Sweden. The former exhibited a decline in its total supply proportion from 10% in 1997 to around 5% in 2010. In stark contrast, Sweden bucked this trend, surging to 10% in 2010 — 5 percentage points up from 1997.

Cost of Water in Australian Cities

TABLE

TASK 1 — QUESTION

The table below shows the cost of water per kilolitre up to 125KL and over 125KL, and the average household water bill, in five Australian cities.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

The table below shows the cost of water in five cities in Australia.

City	Usage charge per kilolitre (up to 125KL)	Usage charge per kilolitre (over 125 KL)	Average bill per household
Adelaide	\$ 0.42	\$ 1.00	\$ 312
Brisbane	\$ 0.81	\$ 0.84	\$ 310
Melbourne	\$ 0.78	\$ 0.78	\$ 253
Perth	\$ 0.42	\$ 1.50	\$ 332
Sydney	\$ 0.98	\$ 0.98	\$ 319

Figure — Table

MODEL ANSWER · 207 WORDS

The table illustrates the cost of water up to 125KL and over 125KL in five Australian cities — Adelaide, Brisbane, Melbourne, Perth, and Sydney — relative to the average bill per household.

Overall, there is an increase in the cost of water exceeding 125KL in all cities but Melbourne and Sydney. Additionally, Perth is the city with the biggest difference between the two tariffs, and it has the highest average bill per household, whereas Melbourne has the smallest tariff difference and the lowest average bill.

Sydney shows the most expensive usage charge per kilolitre up to 125KL at \$0.98, but this rate remains the same beyond 125KL. Brisbane is another city with a high usage charge, at \$0.81 up to 125KL and \$0.84 over 125KL. Melbourne follows in third with the same cost of water in both tariffs, at \$0.78, while Adelaide and Perth charge \$0.42 for water up to 125KL. The former rises to \$1.00, while the latter increases significantly to \$1.50.

Perth tops the list as the city with the highest average bill at \$332, followed by Sydney with a margin of \$13. Adelaide comes in third, with the water bill averaging \$312, while Brisbane ranks fourth with an average water bill per household of \$310. At the bottom of the list is Melbourne, where each household pays \$253.

Redevelopment of a College Café

MAPS / PLANS

TASK 1 — QUESTION

The maps below show a college café in its current state and how it will look after redevelopment.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

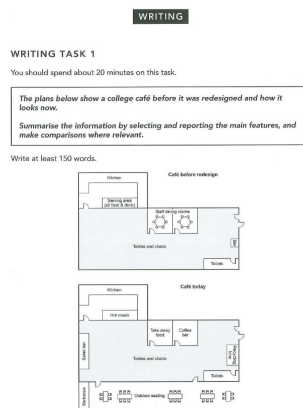

Figure — Maps / plans

MODEL A · 254 WORDS

The maps illustrate the layout of a college café before its redevelopment in relation to its current state. Overall, the café has undergone notable modifications to several facilities. Internally, new amenities have been introduced, including a salad bar, coffee bar, staff dining room, and recycling bins, while an outdoor barbeque area with seating has been constructed externally. These enhancements have made the café more user-friendly and visually appealing. Prior to redevelopment, the café featured a kitchen on the upper left-hand side, which housed a serving area for food and drinks overlooking the main hall. Tables and chairs were positioned in the central area of the building. Two staff dining rooms occupied the northern side, while toilets were situated in the right-hand corner. Entry to the café was from the northeast, with a bin located immediately to the left upon entering. Currently, a dedicated hot meals section now occupies where the original serving area was located. The two staff dining rooms have been transformed into a take-away food section on the left and a coffee bar on the right. A salad bar has been installed on the western wall of the hall, while the standard bin has been replaced with recycling bins. The toilets, tables, chairs, entrance, and kitchen remain unchanged. Outside, a barbeque area is now available to the south, featuring outdoor seating arranged with a barbeque positioned on the western side of the open space. Access to this outdoor area is provided through single-swing doors positioned on both the western and eastern walls.

MODEL B · 212 WORDS

The maps illustrate the layout of a college café before its redevelopment in relation to its current state. Overall, the café has undergone several modifications to its interior facilities, including the introduction of a salad bar, recycling bins, a take-away food section, a coffee bar, and a dedicated hot meals area. Additionally, visitors now have access to an outdoor barbeque area, which also accommodates outdoor seating for enhanced convenience. To begin with, the café's kitchen is positioned on the northern left-hand side, now focusing exclusively on hot meals preparation, whereas it previously served all types of food and drinks. The two staff dining rooms that were originally adjacent on the northern side have been converted into a take-away food section on the left and a coffee bar on the right. In the middle of the hall, tables and chairs remain in their original positions, while toilets are located in the bottom right-hand corner. Moving on, the standard bins have been replaced with recycling bins, positioned immediately to the left of the café entrance on the upper eastern side. An outdoor recreational zone has been added to the southern section, featuring a barbeque grill on the western side and seating areas accessible via single-swing doors on both the western and eastern walls.

WRITING

WRITING TASK 1

You should spend about 20 minutes on this task.

The chart and table below show the results of a survey of library users at a university.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

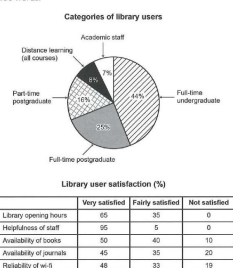

Figure — Table & bar chart

MODEL ANSWER · 198 WORDS

The report examines information about categories of library users and their satisfaction with library facilities at a university. In general, full-time undergraduates represent the majority of users, followed by full-time postgraduates, part-time postgraduates, and distance learners, whereas academic staff constitute the smallest share. A relatively higher proportion of users express high satisfaction compared to those fairly satisfied or dissatisfied, with the greatest satisfaction recorded for staff helpfulness. Examining the shares of different library users, full-time undergraduates comprise a substantial 44%, with full-time postgraduates ranking second at 20%. Part-time postgraduates follow in third place at 16%, while distance learners and academic staff differ by only one percentage point, with 8% and 7% respectively. Regarding library user satisfaction, a significant proportion of users are content with library facilities. Staff helpfulness receives the highest satisfaction rating, with 95% of users highly satisfied, 5% fairly satisfied, and no dissatisfied users. Opening hours also demonstrate strong satisfaction, with 65% highly satisfied and 35% fairly satisfied, with no recorded dissatisfaction. Book availability satisfies 50% of users highly, 40% fairly, and 10% not satisfied, whilst journal availability shows less satisfaction compared to books, with 45% highly satisfied, 35% fairly satisfied, and 20% dissatisfied. Finally, library wi-fi reliability is endorsed by 48% of users as highly reliable, with 33% fairly satisfied and 19% dissatisfied.

Attendance at Music Events in Australia

BAR CHART

TASK 1 — QUESTION

The bar chart below shows the percentage of people in different age groups who attended three types of music event in Australia in 2006.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

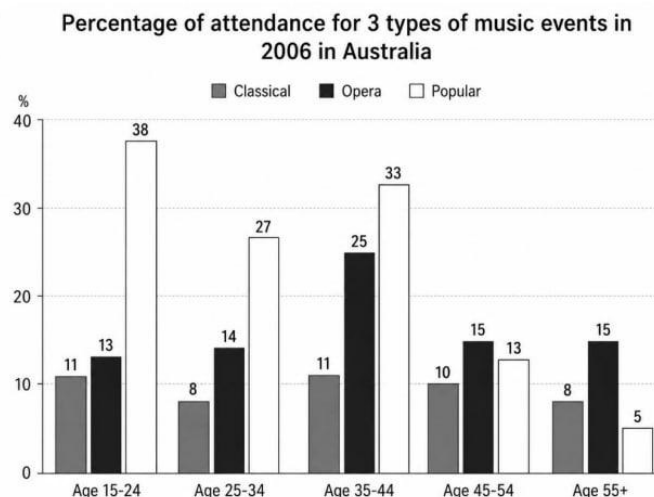

Figure — Bar chart

MODEL ANSWER · 204 WORDS

The bar chart outlines information about the volume of visitors to three types of music events - classical, opera, and popular - in Australia in 2006. Overall, among younger and middle-aged cohorts, the most favoured type of event appeared to be popular music, followed by opera and classical. In contrast, older age groups attended opera concerts more than classical and popular music events.

Starting with the youngest cohort (15–24), popular music events demonstrated the highest attendance share at 38%, which was almost three times greater than that of classical and opera music attendance (13% vs 11%). The same pattern was observed among visitors aged 25–34, with attendance accounting for 27% at popular music events, 14% at opera concerts, and 8% at classical music events. Meanwhile, those aged 35–44 shared similar patterns, albeit at higher percentages - popular music recorded 33% of total attendees, followed by 25% at opera events and 11% at classical music events.

A entirely different pattern emerged among older attendees, as opera was more popular with both age groups (45–54 and 55+) at an identical 15%. Popular music events attracted around 13% of total attendees in the former cohort, which was 3 percentage points higher than that of classical music events. In the latter cohort, these shares dropped noticeably to 8% for classical music events and to a mere 5% for popular music events.

REPORT 26

Films Released & Tickets Sold

BAR CHART

TASK 1 — QUESTION

The charts below show the percentage of films released and the percentage of tickets sold for four types of film in a particular country in 1996 and 2006.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

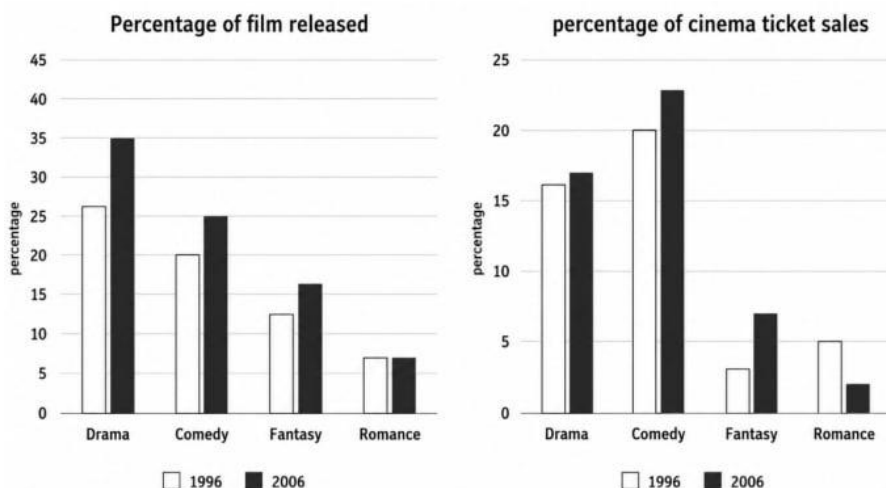

Figure — Bar chart

MODEL ANSWER · 240 WORDS

The report outlines comparisons and changes in terms of releases and ticket sales of four types of films - drama, comedy, fantasy, and romance - over a decade (from 1996 to 2006) in one country.

Overall, films in the drama genre appeared to be the most produced, with romance films reversing this trend, while there was a general increase in release percentage across all genres but the latter. Conversely, by far the largest percentage of ticket sales accounted for the comedy genre consistently, whereas romance repeatedly lagged behind.

With regard to the percentage of films released, 1996 was the year when the most produced films were drama types, making up around 25% — this was up 10 percentage points in 2006. Another highly released genre was comedy, accounting for 20% and 25% in 1996 and 2006 respectively, while fantasy films ranked third, with a margin of 3 percentage points between 1996 and 2006 on an upward trend (13% vs 16%). However, it was only romance films that remained unchanged in terms of releases over the period, placing last at 7%.

Ironically, comedy topped the list in the ranking of most ticket sales, where around 20% of the total sales in 1996 were comedy films, with a 3-percentage-point jump in 2006. The next most-sold genre was drama, though with a negligible increase from 16% to 17% over the period. Other genres followed with a significant margin, as fantasy, selling only around 3% of total tickets in 1996, surged by 5% in 2006. Meanwhile, romance ticket sales reversed this trend, falling from 5% of total sales in 1996 to a mere 2% in 2006.

Courses at Salisbury College

PIE CHART

TASK 1 — QUESTION

The charts below show the percentages of students following different types of course at Salisbury College in 1984, 1994 and 2004.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

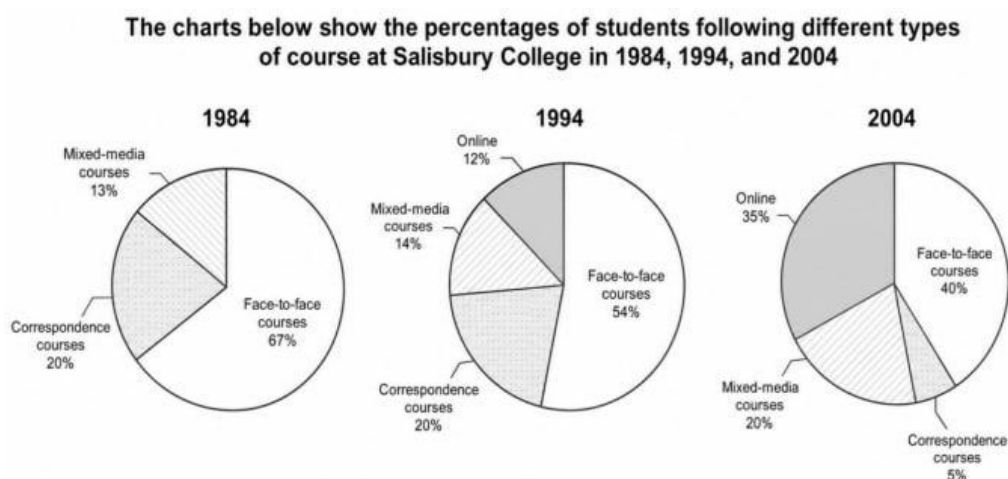

Figure — Pie chart

MODEL ANSWER · 224 WORDS

The pie charts compare percentage terms of Salisbury College students pursuing 4 types of courses in the years 1984, 1994, and 2004.

In 1984, the majority of students gravitated towards in-person courses, making up 67% of the total. Followed closely was the share of students doing correspondence courses at 20% - this was 7 percentage points more than the share mixed-media courses represented.

By 1994, the popularity of in-person lessons remained somewhat unchanged, albeit dropping to 54%, whereas there was no change in the share of correspondence-course followers. The percentage of students enrolled in mixed-media courses edged up to 14%, while the college started offering online courses, which attracted 12% of the total student share.

After a decade, there had been noticeable changes in the interest of students. Despite being again the most followed course, the proportion of those attending face-to-face courses registered a decline of 10% (40%). Online lessons quickly became famous to the point where around 3.5 in 10 of students enrolled in these lessons, while the same scenario was observed for mixed-media courses, making up 20% of the total enrollments. In contrast, there was a noticeable decline to 5% in the share of correspondence courses.

In summary, in-person courses, while demonstrating a downward trend during the period, stayed the most followed type of courses, while the share of correspondence courses mirrored this trend. Other courses - online and mixed-media - appeared to turn out more popular with students over the years.

A College Fire Escape Plan

PLAN / PROCESS

TASK 1 — QUESTION

The plan below shows the fire escape route for student accommodation on the second floor of a college.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant. Write at least 150 words.

The diagram shows the fire escape plan for a student accommodation in the second floor of a college. Summarise the information by selecting and reporting the main features, and make comparisons where appropriate.

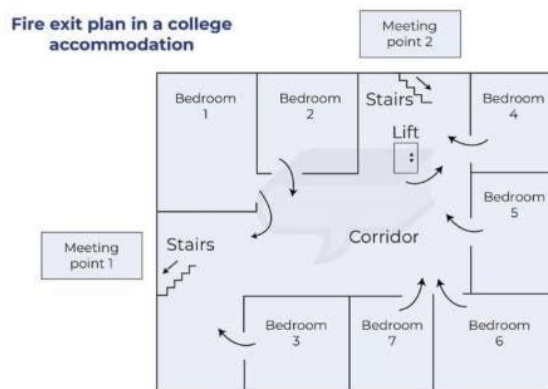

Figure — Plan / process

MODEL ANSWER · 173 WORDS

The report outlines the fire escape plan for student accommodation on the second floor of a college.

Overall, the escape plan involves two meeting points located on opposite sides of the floor, with a lift positioned near the stairs leading to Meeting Point 2. Rooms are arranged on both sides of the corridor, with clear guidelines indicating which meeting point each bedroom should follow.

Regarding Meeting Point 1, bedrooms 1 and 2, located in the top section of the corridor, are directed to use the stairs on the western side leading to this meeting point. Likewise, students in bedroom 3, situated in the bottom-left area of the corridor, are also planned to evacuate to Meeting Point 1.

Meeting Point 2, however, serves a larger number of students. Bedrooms 4 and 5, positioned on the right wing of the corridor, are directed to this point via the stairs located at the top. Additionally, students using the lift near those stairs are also expected to proceed to Meeting Point 2. Bedrooms 6 and 7, situated at the bottom of the corridor, are likewise directed to Meeting Point 2.
